U.S. net energy imports continue to decline (except for liquids in the near term) reflecting increased oil and natural gas production coupled with slowly growing or falling demand.

- The share of net imports in total U.S. liquids consumption declines from 60% in 2005 (24% in 2015) to 7% by 2040, which would be its lowest level since 1957.
- The United States becomes a net exporter of natural gas before 2020, largely because of growth in liquefied natural gas exports.
- The United States continues to be a net exporter of coal (including coal coke) over the entire projection.

Imports as a % of consumption / OPEC share of imports
